1) Finish this method that swaps the values in the array at index i and j

   public void swap(int[] array, int i, int j) {

   }

2) Finish this method that takes an array as a parameter and reverses the order (you don’t need another array!)

   //Ex: {1, 4, 3, 6} -> {6, 3, 4, 1}... notice what happens to the first and last elements

   public void reverse(int[] array) {

   }

3) Finish this method that returns true only if the parameter array is in increasing order (i.e. {1, 2, 3} : yes; {2, 1, 3}: no)

   public boolean isIncreasing(int[] array) {

   }
